ECS7032P Assignment 1 – Individual Reflection

Hakan Coskun · Student no. 241076864 · Group W

Group report: Decoupled Information-Set MCTS with a Card-Value Model for Sushi Go!

In the first weeks all three of us experimented with the TAG code and each tried an agent of our own, which taught us how the framework and Sushi Go! work. As group leader I then divided the work between us so that each of us carried an equal share. My own part was research and decisions: I researched strategies for Sushi Go! and the search methods used for card games, compared them with the agents we had tried, and made the decision on which idea we would develop: BasicMCTS, the permitted base agent, extended with a model of how much each card is worth and a search that suits hidden hands and simultaneous moves.

Halit then worked on this idea and turned it into our final agent, while Weronika studied the agents in depth so that our comparisons were sound.

Leading the group taught me that agreeing early on one central idea, and testing it carefully, works better than trying many unrelated ones.

Use of generative AI: as our report states, we used Claude (Anthropic) for the code and the drafting; this reflection was also drafted with Claude from our own account of the work.
