ECS7032P Assignment 1 – Individual Reflection

Halit Ozger · Student no. 230625112 · Group W

Group report: Decoupled Information-Set MCTS with a Card-Value Model for Sushi Go!

We began by each building a first agent of our own in TAG, to learn the framework and the game. Once Hakan had compared the options and we had chosen one idea, my part, an equal share of the work, was to build it. I set up our package and developed the agent as a modified copy of BasicMCTS within the module's rules: nothing from the advanced MCTS agent, no change to the framework, everything inside the groupW package. As our report states, we wrote the code with Claude; my part was to direct that work, turn the chosen design into concrete modifications, keep each one as a switch so that it could be tested on its own, and run and check the experiments. I also prepared the competition file and checked that the agent compiles and plays in a fresh copy of TAG.

Weronika's research on the agents showed us how to compare ours with them properly, and Hakan's research and decision gave the code its direction.

Building the idea step by step showed me how much a good evaluation of a position matters, and that more thinking time does not automatically make an agent stronger.

Use of generative AI: as our report states, we used Claude (Anthropic) for the code and the drafting; this reflection was also drafted with Claude from our own account of the work.
