# ECS7032P Assignment 1 – Individual Reflection

**Weronika Diana Podgorska** · Student no. 230394735 · Group W

*Group report: Decoupled Information-Set MCTS with a Card-Value Model for Sushi Go!*

During the first weeks each of us played with the framework and wrote a simple agent. We then shared the work equally, and my part was in-depth research on the agents, so that we could compare them properly. I studied how TAG's agents and the methods behind them work, such as BasicMCTS, information-set MCTS, decoupled UCT for simultaneous moves and the simpler framework agents, and what each of them assumes about hidden cards and the other players. This told us which agents to compare ours with and how to make the comparison fair: the same time per decision for every agent, every seat played equally often and enough games for clear results. It also helped with the technical details of our own agent.

Hakan weighed up the strategies and chose our approach, and Halit built the agent from it.

The research showed me that the right method depends on the game, and that a fair comparison needs as much care as the agent itself.

*Use of generative AI: as our report states, we used Claude (Anthropic) for the code and the drafting; this reflection was also drafted with Claude from our own account of the work.*
